Installation

After downloading the file from Themeforest, You will find SuperProps.zip file. Then unzip the
SuperProps.zip and run the following commands on SuperProps folder to get started with the project.

```
yarn
```

```
// For starting NextJs Server run
yarn next-dev
```

NextJs Server will start in `localhost:3000`

Available routes are below

```
/app
/appmodern
/appclassic
/appminimal
/saas
/saasmodern
/saasclassic
/saasminimal
/saasminimal2
/hosting
/hostingmodern
/portfolio
/ride
/crypto
/cryptomodern
/charity
/interior
/agency
/agencymodern
/agencydigital
/saascreative
/fooddelivery
/saasappdark
/appcreative2
/webapp
/webappminimal
/webappcreative

...

```

Folder Structure

```
/packages
    /landing [NextJs version of the project]
```

Stack We Have Used

1. Lerna (A tool for managing JavaScript projects with multiple packages. https://lernajs.io)
2. Yarn Workspace
3. React Js and Next Js
4. Styled System and Styled Components
5. Firebase Deployment.
6. Vercel Deployment.

Development

Follow the below procedure to go with the development process.

NextJs

You can change your code according to your wish. For example, you want to work with the `app` template. You have to go the `/app` route. If you want to use this template only, then you have to follow below procedure.

1. Go to `/landing/pages/`
2. now copy all the content from `app.js`
3. Paste all the content in `/landing/pages/index.js`

Now for cleaning the unused code in your project follow the below procedure.

1. Now you can delete all other pages except `_app.js`, `_documents.js` and `_error.js`. That mean in your `/pages` folder you will have four files `index.js`, `_app.js`, `_documents.js` and `error.js`
2. From `/landing/containers/` folder you can delete all other folder except `App` and `Error`
3. From `/common/assets/image/` folder you can delete all other folder except `app`. Do not delete any files from there like `404.svg`, `error.svg` etc.
4. From `/common/data/` folder you can delete all other folder except `App`.
5. From `/common/theme/` folder you can delete all other folder except `app`. Do not delete the `index.js` file.

To start the server for `nextjs` you have to run `yarn nextjs-dev` and the server will start on `locahost:3000`.

Explaining Containers

In the `containers` directory you will get folder for our every template. If you want to use App template. Then in the `App` directory you will get folders containing different section of the template like `Banner`, `Footer`, `Testimonial`, `Navbar` etc.

All of these containers contains regular reactjs code.

Deployment

For deploying your final project you have to build your project first. To build the project you have to follow below procedure.

NextJs

To build the nextjs version run below commands.

```
yarn next-build

// To check the build version locally run below command
// Not necessary if you don't want to check on your local.

yarn next-start
```

We removed the `next-export` support from our template and we recommend to use `next-build` and `next-start` to run our template.

But if you want to use 'next-export', then at first please go to packages->landing->next.config.js and replace the code with

const nextConfig = { images: { domains: ['pbs.twimg.com'], loader: 'akamai', path: '', }, };

Then , run `next build && next export` in your terminal.

Running with Docker

To run the SuperProps Next.js app in docker

```
yarn next-export
docker build -t superprops/landing-next -f ./packages/landing/Dockerfile .
docker run -it -p 3000:3000 superprops/landing-next:latest
Open http://localhost:3000
```

Deployment Support

vercel.com

NextJs

For deploying nextjs on vercel.com go to `packages/landing`. Now run below command .

```
vercel
```

> **Make sure you have `vercel-cli` installed in your system.**

Firebase

NextJs

Add your project ID at `packages/landing/.firebaserc`

Then, To deploy to your site, run the following command from the `packages/landing` directory.

```
yarn deploy
```

> **Make sure you have `firebase-tools` installed on your machine.**

Netlify

At first, open an account on netlify and go to `sites` tab.

NextJs

Run the below command to make the project netlify deploy ready from `packages/landing`.

```
yarn next build && next export
```

After running the above command go to `/landing` folder. You will find a `out` folder there. Drag and drop this `out` folder on netlify `sites` tab. Now after finishing the upload you are ready to go.
